Every computer science student knows binary trees. Here is one of many possible definitions of binary trees. Binary trees are defined inductively. A binary tree t is either an external node (leaf) •; or a single ordered pair (t_1, t_2) of two binary trees, left subtree t_1 and right subtree t_2 respectively, called an internal node. Given an integer n, B(n) is the set of trees with n leaves. For instance, the picture below shows the two trees of $B(3) = \{(\bullet, (\bullet, \bullet)), ((\bullet; \bullet), \bullet)\}$.

Observe that those trees both have two internal nodes and a total of five nodes.

Given a tree t we define its unique integer identifier N(t):

1.
$$N(\bullet) = 0$$

2. $N(t_1, t_2) = 2^{n^1 + n^2} + 2^{n^2}N(t_1) + N(t_2)$, where n_1 and n_2 are the number of nodes in t_1 and t_2 respectively.

For instance, we have $N(\bullet, \bullet) = 2^2 + 2^1 \times 0 + 0 = 4$, $N(\bullet, (\bullet, \bullet)) = 2^4 + 2^3 \times 0 + 4 = 20$ and $N((\bullet, \bullet), \bullet) = 2^4 + 2^1 \times 4 + 0 = 24$.

The ordering \succeq is defined on binary trees as follows:

$$\begin{array}{c}
\bullet \succeq_{t} \\
t \\
(t_1, t_2) \succeq_{(u_1, u_2), \text{ when } t_1} \succeq_{u_1, \text{ or } t_1 = u_1 \text{ and } t_2} \succeq_{u_2}
\end{array}$$

Hence for instance, $(\bullet, (\bullet, \bullet)) \stackrel{\succeq}{=} ((\bullet, \bullet), \bullet)$ holds, since we have $\bullet \stackrel{\succeq}{=} (\bullet, \bullet)$.

Using the ordering \succeq , B(n) can be sorted. Then, given a tree t in B(n), we define S(t) as the tree that

immediately follows t in the sorted presentation of B(n), or as the smallest tree in B(n), if t is maximal in B(n). For instance, we have $S(\bullet, \bullet) = (\bullet, \bullet)$ and $S(\bullet, (\bullet, \bullet)) = ((\bullet, \bullet), \bullet)$. By composing the inverse of N,S and N we finally define a partial map on integers.

$$s(k) = N(S(N^{-1}(k)))$$

Write a program that computes s(k).

Input

The first input line contains an integer K, with K > 0. It is followed by K lines, each specifying an integer k_i with $1 \le i \le K$ and $0 \le k_i < 2^{31}$.

Output

For each test case, the output should consist of K lines, the i-th output line being $s(k_i)$, or NO' if $s(k_i)$ does not exist.
